USB Interfaces completely cure the problem of a lack of Serial COM ports for your devices. Solves problems of interconnectivity between computer and radio, keying, rotors, SO2R box, and TNC. Attach as many USB Interfaces as you need for full connectivity.

USB Interfaces works under Windows 98/ME/2000/XP, Apple Macintosh OS8/OS9/OS-X. MS-DOS is NOT supported. Linux 2.4.0 and above has support in the core, PID numbers must be changed.

Each properly installed USB Interface (using the provided [driver](#)) behaves like a virtual Serial COM Port for the operating system.

USB Interfaces have built-in hardware support for your radio. This means that you no longer need additional level converters like CT-62, IF-232, FIF-232, CT-17. Just choose one for your radio model.

There are drivers for CW (DTR) and PTT (RTS) keying, so you do not need to buy extra interfaces for keying by computer.

Unlike common computer mass "USB to Serial adapters" our USB Interfaces are carefully designed for maximum immunity against strong RFI and harsh environment and at the same time be "RF quiet". Only known product of USB chipset clock is a beat at 144.030MHz. Each data input is filtered by 3 poles low pass LC filter. Interfaces are powered from USB port and do not need additional powering. Current consumption meets USB 2.0 bus powered standard.

A snapshot of microHAM USB interfaces webpage, around 2005-2007. Very old now.

DB9-KY -probably a variation for Kenwood. Same lines though, PTT, CW and CAT.

Technical specification:

Metal case, shielded cables, gold plated connector.

USB: USB 2.0 Full speed , USB 1.1 compatible

Radio Port: RXD, TXD, max. 57600 Bd

CW: open collector, driven from DTR, max 30V/400mA

PTT: open collector, driven from RTS, max 30V/400mA

Foot switch: input, close to ground to activate. Wired to CTS and RTS

Dimensions: W 60mm (2.4") x H 25mm (1") x D 80mm (3.2")

Weight: 300 g (2/3 lbs)

\$50

USB <-;> Radio

Package includes:

micro USB Interface™ 1 pc, installation manual, drivers on CD-ROM

... latest drivers you can download from our [downloads page](#)

If your favorite logger does not support Radio Control and CW/PTT at the same virtual COM port, uninstall current driver and install microHAM USB Device Router. Use this approach also if you have problems with CW timing. Read this [application note](#) !

Jupiter , Orion , Pegasus

If you plan to use the interface with N4PY software, the TenTec GUI, or firmware updates to the radio then order the [USB <--> RS232](#) model with full

handshaking lines (RTS, CTS, etc.). Note that this does not provide the PTT or CW keying capabilities needed for some contest software.

If you plan to use contest software that provides a CW keying output, but you do not need to use the TenTec GUI or do firmware updates, then order the DB9-T interface, which provides cables for PTT and CW keying output as well as footswitch PTT input. Note that it cannot be used for the TenTec GUI or firmware updates, which require that RTS/CTS be wired to the DB-9 connector.

Argonaut V

BUY NOW

USB Interface - RS232

USB to RS-232

DB9 male (RXD, TXD, RTS, CTS, DTR, DSR, RI, GND signals)

Model with full handshake. Support RTS , CTS , DTR , DTS. Suitable for all RS-232 devices like TenTec radios, [micro BAND DECODER](#), [micro STACK MAX](#), K1EL WinKey, W5XD MultiKeyer, all RS-232 rotor controllers, TNC's, etc ...

The interface does not support low baud rates under 300Bd and 5-bit data length. Consequently, FSK is not supported.
